

Project Report

Timothy Mok and Aron Saengchan | Group 30

Summary

This project focuses on a data set of statistics for the Ontario Public Library System from 2017 to 2019, made available by the Government of Canada [1]. Approximately 380 libraries self-report the data, providing general information such as the library names, codes, and addresses, as well as specific statistics on the number of cardholders and the number of English and French resources available at each branch. The project incorporates these data sets into an interactive portal for users to use as part of the Ontario Public Library System.

The program opens to a **Main Menu** where the user has four options to choose from:

1. **Branch Information Search** – The user is prompted to enter a library name or code and the program will provide them with specific information, including the address, website, and number of print/electronic resources available at that branch.
2. **Library Locator** – The user is prompted to enter a postal code and the program searches for any nearby libraries, while also considering the user's needs. If any nearby branches are found, the program prints a list of them and allows the user to obtain information about a specific branch.
3. **Access Yearly Archives** – The user is prompted to enter a year between 2017 to 2019 and the program displays various statistical information from that year, from statistics of all library branches in the system to specific record-holders of each column in the data set.
4. **Quit** – Exits the program.

After each action, the user can perform the previous action again or return to the Main Menu.

Program Specifications

To address the given specifications, the table below describes how each requirement was achieved in this project.

Specifications		Lines	Description
Dataset Selection	Selected Data	405	Data sets were imported from the three spreadsheets located in the <i>Ontario Public Library Datasets</i> directory
DataFrame Creation	Merge/Join Operation	410	<i>merge()</i> was used twice to combine the three data sets together
	Hierarchical Index	417	Indices were sorted by 'Library Full Name' → 'Library Code' → 'Year'
User Entry	User Selection	46	Three options are listed in the <i>Main Menu</i> (see <i>Summary</i> section)
Analysis and Calculations	Describe Method	326	<i>describe()</i> was used to print some general statistics in the <i>Yearly Archives</i>
	Adding Two Columns	433	'Total Resources' and 'Resources per Cardholder' columns were added to the DataFrame
	Aggregation Computation	320 344 364	<i>sum()</i> was used to aggregate a sum row in the described data and used on grouped data for plotting, while <i>max()</i> was used to find the library record-holders in the <i>Yearly Archives</i>
	Masking Operation	214	Masking was used to filter postal codes that matched the user's input
	Groupby Operation	320 364	<i>groupby()</i> was used to calculate the sum by year for the described data and also used to help construct the plots using Matplotlib
	Pivot Table	331	Pivot table was used to compare the 'Average Resources per Cardholder' by 'Service Region' and 'Service Type' in the <i>Yearly Archives</i>
	Functions/Methods	–	Two user-defined functions and eight class methods were created
Export and Matplotlib	Exported Data	455	DataFrame was exported to <i>exported_library_statistics.xlsx</i> in the working directory
	Create Plot	368 382	Two plots were generated using Matplotlib to illustrate the comparison of resources by language/type for a specified year and on a yearly basis
